

Diamond

This machine has small metal heads with a coarse surface (sterilisable)

This machine works using **negative pressure** (sucks air) Measured using inHg or Hg for short.

Depth of treatment is determined by coarseness of the diamond head (the higher the number the smoother the head) and the Hg pressure.

Low maintenance with only filters to purchase and dispose of (replacement heads when worn out). Filters must be disposed of in clinical waste. Filters are low cost.

There is very little waste and easy to clean.

Effective treatment.

Crystal

This machine has plastic replaceable heads (single use)

This machine works using **negative pressure** (sucks air) Measured using inHg or Hg for short.

Depth of treatment is determined by Hg pressure only.

High maintenance with replacement crystals needed when they run out and new heads for every client. Crystals must be disposed of in clinical waste. New crystals vary in cost.

There is more waste and crystals must be cleaned from beauty room after treatment.

More effective treatment.
